 Efficacy and safety of more intensive lowering of LDL cholesterol: a meta-analysis of data from 170 000 participants in 26 randomised trials

Cholesterol Treatment Trialists' (CTT) Collaboration\*

- M/F, young/old, DM/no DM, HTN/no HTN, Smoking/No smoking

**Exception: Only population in which statins have not shown benefit is ESRD on HD (Fellstrom BC NEJM 2009, AURORA trial)**

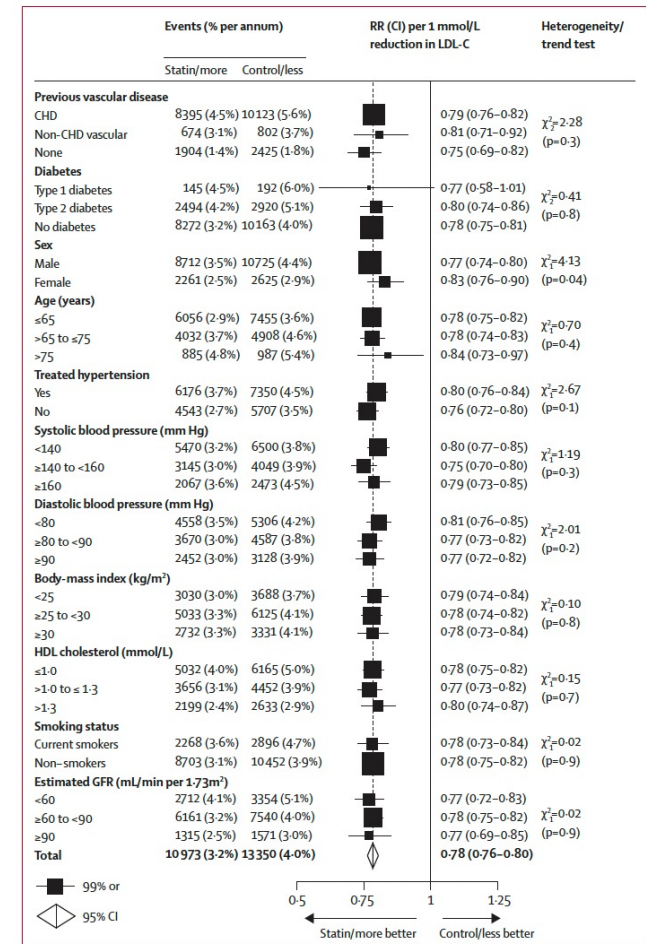

Figure 3: Effects on major vascular events per 1.0 mmol/L reduction in LDL cholesterol, by baseline prognostic factors. Rate ratios (RRs) are plotted for each comparison of first event rates between treatment groups, and are weighted per 1.0 mmol/L LDL cholesterol (LDL-C) difference at 1 year. Missing data are not plotted. RRs are shown with horizontal lines denoting 99% CIs or with open diamonds showing 95% CIs. CHD=coronary heart disease. GFR=glomerular filtration rate.

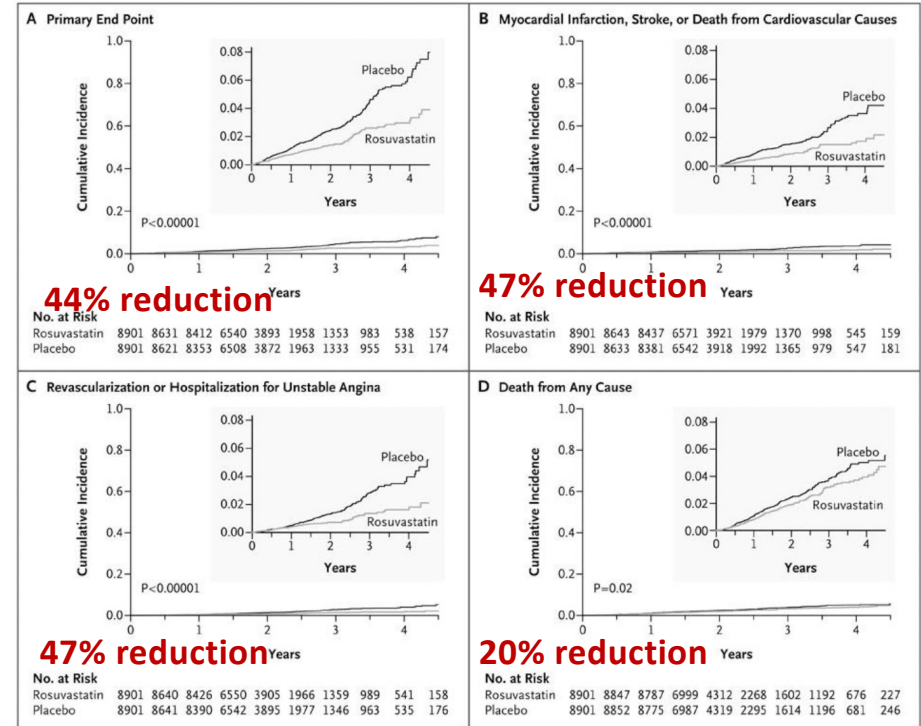

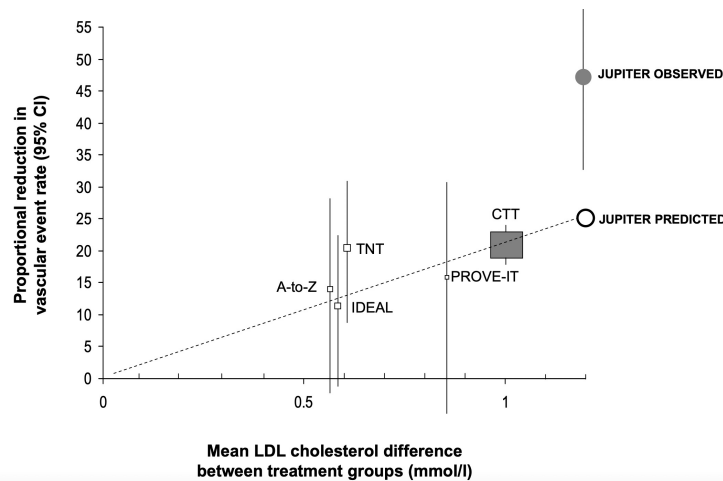

## What was the JUPITER study?

### Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein

Paul M Ridker, M.D., Eleanor Danielson, M.I.A., Francisco A.H. Fonseca, M.D., Jacques Genest, M.D., Antonio M. Gotto, Jr., M.D., John J.P. Kastelein, M.D., Wolfgang Koenig, M.D., Peter Libby, M.D., Alberto J. Lorenzatti, M.D., Jean G. MacFadyen, B.A., Børge G. Nordestgaard, M.D., James Shepherd, M.D., James T. Willerson, M.D., and Robert J. Glynn, Sc.D., for the JUPITER Study Group\*

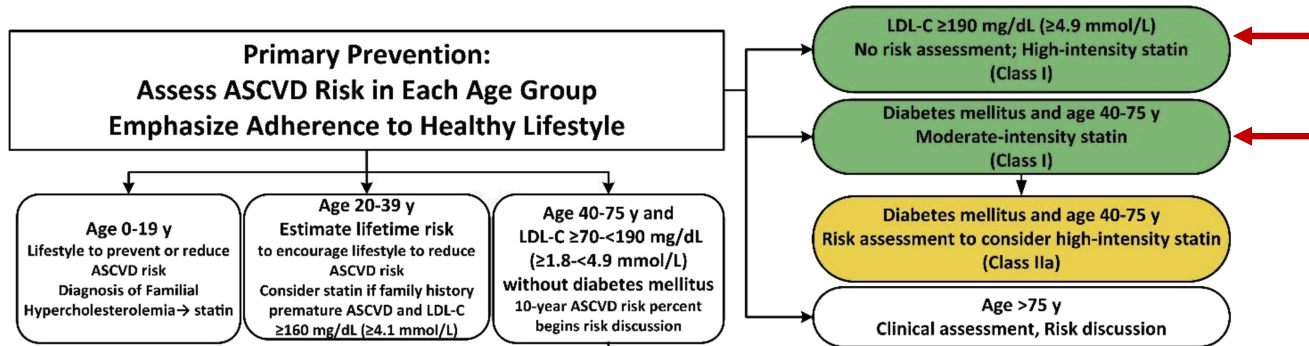

17802 men ( $\geq$ age 50) and women ( $\geq$ age 60)  
LDL  $<$ 130mg/dL and hsCRP  $\geq$ 2.0mg/L  
LDL-C reduced by 50% and hsCRP by 37%

NNT for 5 years to prevent 1 event is 25

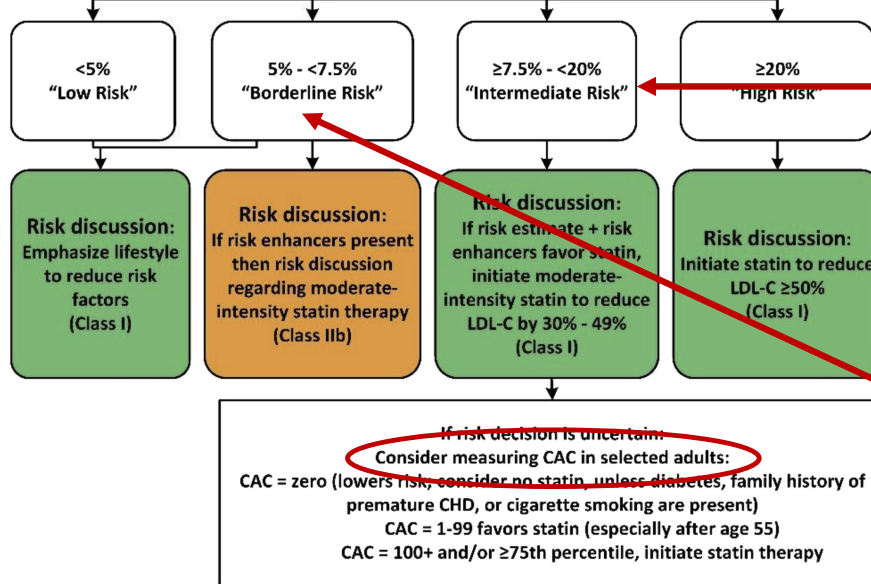

*Before REPRIEVE, what were the guidelines for statin treatment in PWH?*

- ASCVD Risk Enhancers:**
- Family history of premature ASCVD
  - Persistently elevated LDL-C ≥160 mg/dL (≥4.1 mmol/L)
  - Chronic kidney disease
  - Metabolic syndrome
  - Conditions specific to women (e.g., preeclampsia, premature menopause)
  - Inflammatory diseases (especially rheumatoid arthritis, psoriasis, HIV)
  - Ethnicity (e.g., South Asian ancestry)
- Lipid/Biomarkers:**
- Persistently elevated triglycerides (≥175 mg/dL, (≥2.0 mmol/L))
- In selected individuals if measured:**
- hs-CRP ≥2.0 mg/L
  - Lp(a) levels >50 mg/dL or >125 nmol/L
  - apoB ≥130 mg/dL
  - Ankle-brachial index (ABI) <0.9

**\*Moderate intensity statins are recommended for ALL pts (w/wo HIV) with 10 year risk of ASCVD ≥7.5**  
*"Using the PCE, 2013 ACC/AHA guidelines identified ≥7.5% risk as RCT supported threshold for benefit of statin tx"*

*HIV as a "risk enhancer" which would favor starting moderate/high intensity statin among individuals at borderline risk (between 5-<7.5%)*

## **Traditional risk calculators underestimate ASCVD risk in HIV**

- Traditional risk factors are associated with increased CVD risk in HIV
- Risk predictors developed in non-HIV populations may not predict risk in HIV due to different etiologies
- HIV-specific calculators have been proposed (biomarkers, ART)
- Multiple different studies have concluded that traditional risk calculators underestimate CV risk in HIV

***Focusing on only known pathways for CVD risk or limited number of markers may not yield the best risk prediction in HIV***

## Question:

*Does the REPRIEVE trial mean that all PWH should be on pitavastatin?*

- Yes!
- No!

# REPRIEVE Trial Schema

# Inclusion criteria for REPRIEVE is complicated

PWH aged 40-75 years, stable ART

Low to moderate risk of ASCVD using 2013 ACC/AHA pooled cohort equation with a risk up to 15%

DM if LDL-C < 70mg/dL

ASCVD risk > 15% if LDL < 70 mg/dL

Median ASCVD risk score of 4.5%, 28% had score of 0 to 2.5

Median LDL at entry of 107mg/dL decreased to 74mg/dL in pitavastatin treated group

## Fasting LDL cholesterol as follows:

- If ASCVD risk score <7.5%, LDL cholesterol must be <190 mg/dL
- If ASCVD risk score  $\geq$ 7.5% and  $\leq$ 10%, LDL must be <160 mg/dL
- If ASCVD risk score >10% and  $\leq$ 15%, LDL must be <130 mg/dL

**NOTE:** If LDL <70 mg/dL, participant is eligible regardless of 10-year ASCVD risk score in line with the ACC/AHA 2013 Prevention Guidelines.

# REPRIEVE: Main Outcomes

**B** First MACE

**C** First MACE or Death

• Consistent effect among subgroups

Grinspoon S NEJM 2023

# Primary Prevention with Statins Guidelines

## Based on Predicted ASCVD risk (and NNT)

(<https://tools.acc.org/ascvd-risk-estimator-plus/#!/calculate/estimate/>)

<u>ACC/AHA</u>	ASCVD Risk	NNT-5y	<u>USPSTF</u>
Treat	10-20%	40-60	Treat
Consider	7.5-10%	60-80	Consider
	5-7.5%	80-120	Don't Consider
Don't Consider	<5%	>120	

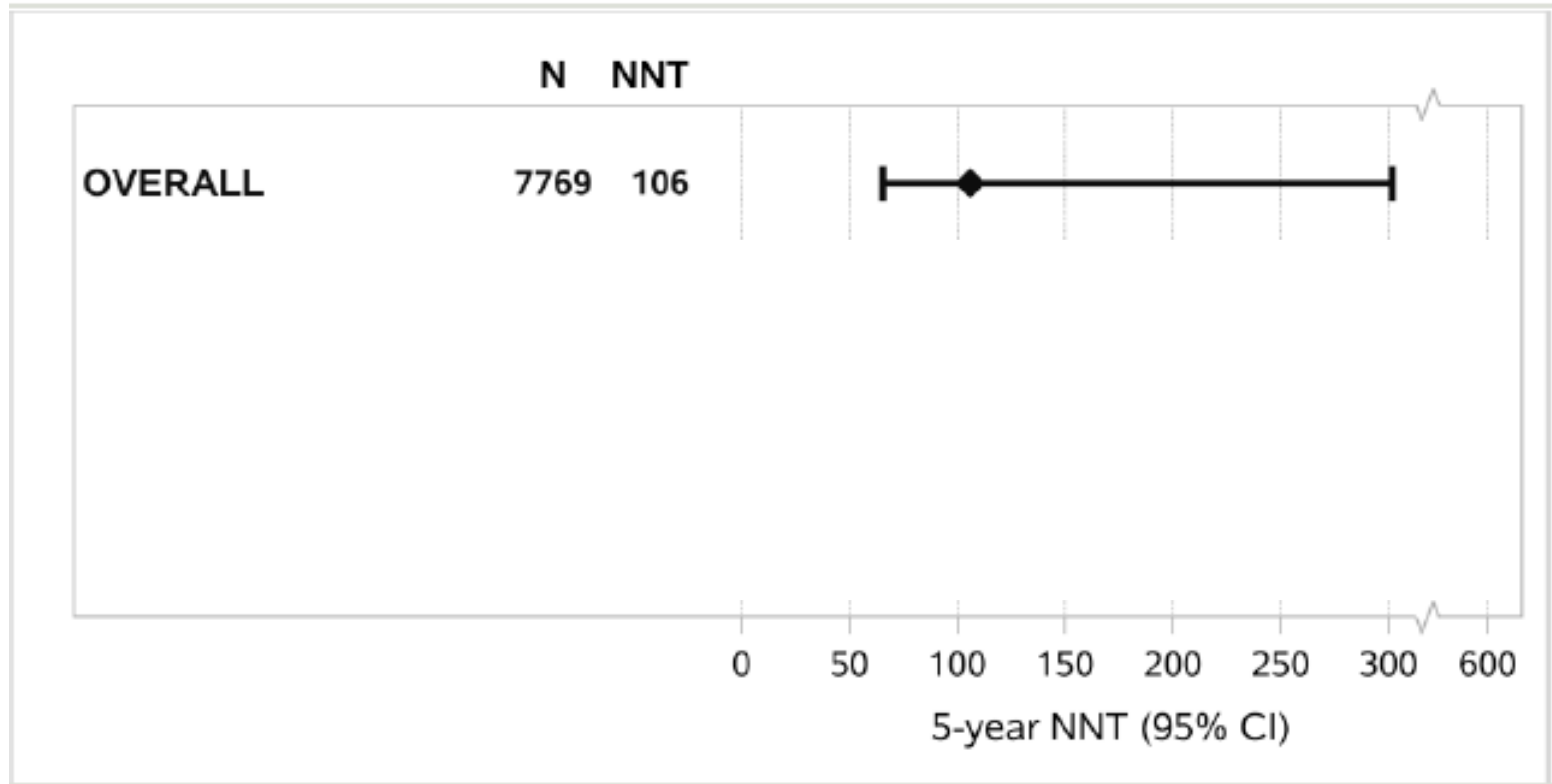

*What is the NNT?*

Slide from P. Hunt

AHA/ACC Guidelines, Circulation, 2018; USPSTF, JAMA, 2022

# What was the NNT in the REPRIEVE Trial?

(b) 5-year NNT

# How Does REPRIEVE Result Compare to Existing Treatment Thresholds?

(<https://tools.acc.org/ascvd-risk-estimator-plus/#!/calculate/estimate/>)

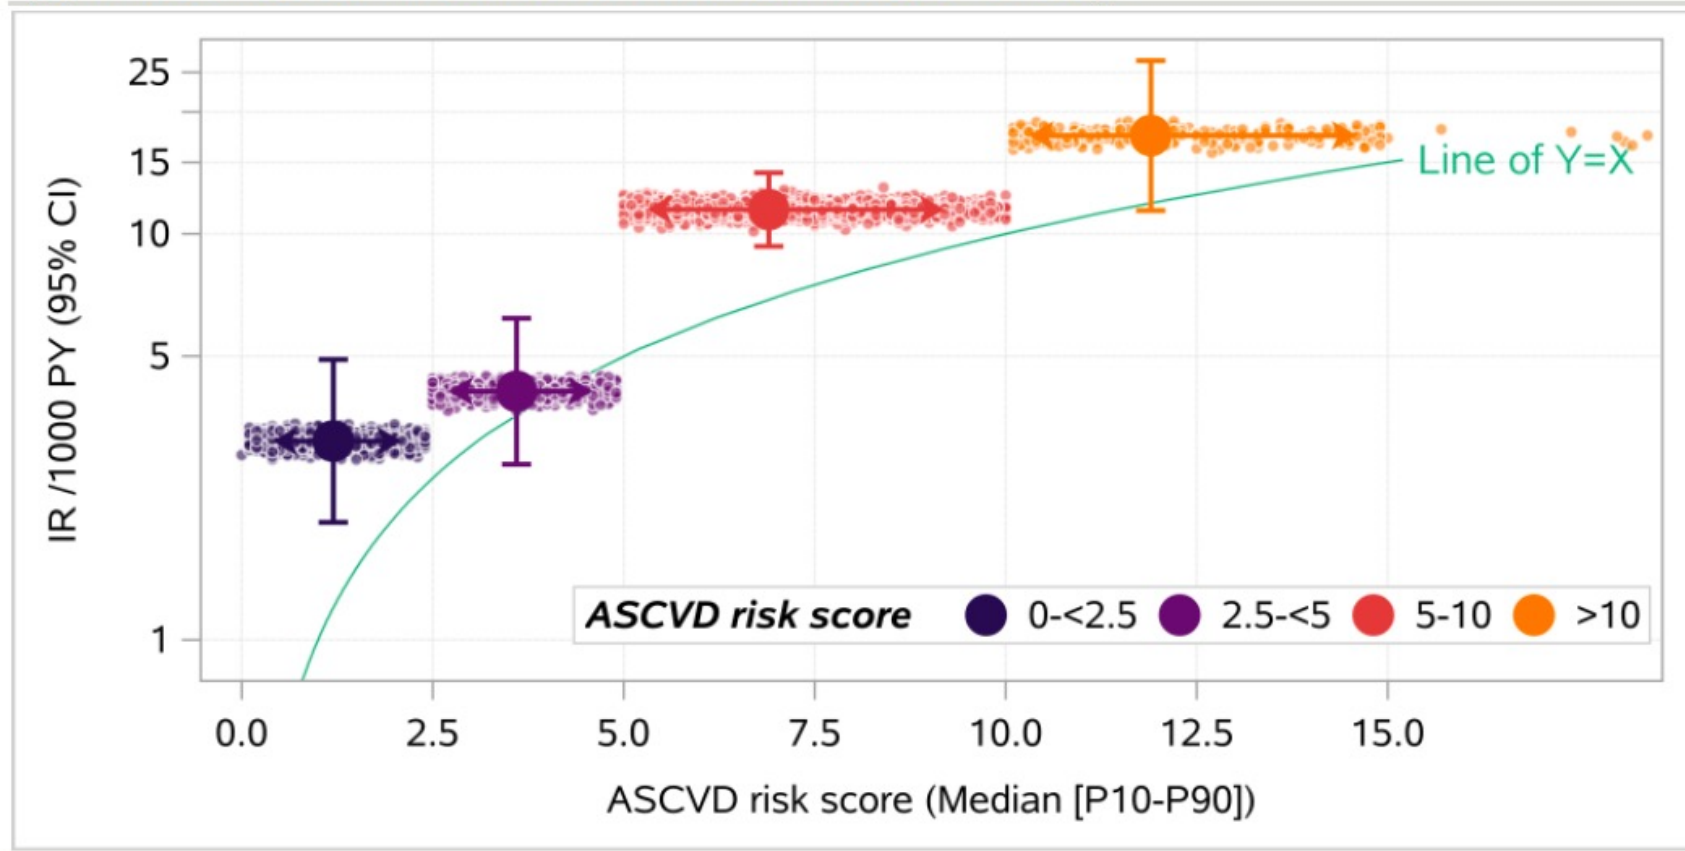

If we follow NNT thresholds used in existing statin guidelines, only PWH with ASCVD scores >5% would be recommended for statins.

<u>ACC/AHA</u>	ASCVD Risk	NNT-5y	<u>USPSTF</u>	
Treat	10-20%	40-60	Treat	← REPRIEVE with ASCVD score >5% (<1/2 participants)
Consider	7.5-10%	60-80	Consider	
	5-7.5%	80-120	Don't Consider	← Overall REPRIEVE result
Don't Consider	<5%	>120	Don't Consider	← REPRIEVE with ASCVD score <5% (>1/2 participants)

AHA/ACC Guidelines, Circulation, 2018; USPSTF, JAMA, 2022; slide from P. Hunt

# HIV Does Increase CVD Risk by ~63%

(a) Incidence of First MACE in the Placebo Group

Slide from P. Hunt

# ASCVD Risk Score May Underestimate CVD Risk to a Greater Extent in Women with HIV

- HIV may attenuate the “female advantage” in CVD risk
- Results raise the question whether more women than men should be newly eligible for statins because of REPRIEVE

Does low ASCVD risk in PWH = no benefit from statin?

- Using ACC/AHA guidelines, 2/3 of PWH were not recommended to be on statin had evidence of significant carotid plaque (Phan BA, Circ CV Imaging 2017).
- Among PWH with calculated ASCVD risk of < 2.5%, 30% had plaque on CT angiography (Hoffmann U, Jama Network Open 2021).
- 35% of PWH had CAC>0 (Hoffman U, Jama Network Open 2021).
- ***Question: Should we consider imaging in asymptomatic PWH who are at intermediate risk for CVD?***

# In PWH with Low ASCVD Risk (2.5-5%), Perhaps more Women than Men Should be Considered for Statins

(<https://tools.acc.org/ascvd-risk-estimator-plus/#!/calculate/estimate/>)

*How would NNT-10y change our thinking?*

<u>ACC/AHA</u>	ASCVD Risk	NNT-5y	<u>USPSTF</u>	
Treat	10-20%	40-60	Treat	← <b>REPRIEVE with ASCVD score &gt;5% (&lt;1/2 participants)</b>
Consider	7.5-10%	60-80	Consider	
Don't Consider	5-7.5%	80-120	Don't Consider	← <b>REPRIEVE <u>women</u> with ASCVD score 2.5-5%</b>
Don't Consider	<5%	>120	Don't Consider	← <b>REPRIEVE <u>men</u> with ASCVD score &lt;5%</b>

AHA/ACC Guidelines, Circulation, 2018; USPSTF, JAMA, 2022, slide from P. Hunt

## Question:

- Does the REPRIEVE trial mean that all PWH should be on statins?
  - Yes!
  - No!

*My answers: not all PWH, but likely increased use among those aged 40-75 –more use among those with ASCVD risk of 5% and higher*

*Statin use already indicated in DM (with or without HIV)*

*Statin use already indicated in persons with risk of 7.5% and above (with or without HIV)*

*Some PWH with ASCVD risk  $\leq 2.5\%$  may benefit from statin*

# Opportunities for Improvement in Statin use among PWH

*> 50% eligible for statins were not on them*

**REPRIEVE results are an important reminder to all clinicians to think about statins in PWH who meet criteria; even before the study results, PWH were undertreated.**

10-year ASCVD risk  $\geq$  7.5%, LDL-C  $\geq$  190 mg/dL, or age 40-75 years with diabetes

Megan Mclaughlin AIDS 2023

Pitavastatin: what do we know?

*1. **T/F:** For individuals with ASCVD, Pitavastatin is clinically indicated*

*2. **T/F:** Pitavastatin is cost effective for use in PWH*

*3. **Fill in the blank:***

*In the past 20 years, Dr. Hsue has prescribed pitavastatin \_\_\_\_ times*

# Pitavastatin is a moderate intensity statin

- High-intensity statins ( $\geq 50\%$  ↓):
  - Atorvastatin 40-80mg
  - Rosuvastatin 20-40mg
- Use high-intensity for:
  - Treatment of ASCVD
  - High-risk primary prevention

**Table 1**

## HMG-CoA Reductase Inhibitors

Intensity (percent-lowering)	Statin	Dosing Range
Low (10%-29%)	Fluvastatin	20-40 mg
	Lovastatin	20 mg
	Pitavastatin	1 mg
	Pravastatin	10-20 mg
	Simvastatin	10 mg
Moderate (30%-49%)	Atorvastatin	10-20 mg
	Fluvastatin	80 mg
	Lovastatin	40 mg
	Pitavastatin	2-4 mg
	Pravastatin	40-80 mg
	Simvastatin	20-40 mg
High ( $\geq 50\%$ )	Atorvastatin	40-80 mg
	Rosuvastatin	20-40 mg

*HMG-CoA: 3-hydroxy-3-methylglutaryl-coenzyme A.  
Source: References 2, 4.*

Slide from C. Dejong

# Lower is better not only for LDL but also inflammation

Secondary prevention with 80mg atorvastatin vs. 40mg pravastatin

Secondary prevention: simvastatin vs. simva + ezetimibe

# Anti-inflammatory effects differ among statins

- PROVE IT and MIRACL trials – high-intensity atorva or rosuva reduce MACE after MI
  - Rapid benefit seen within 30 days
  - 34%-38% reduction in hsCRP
- A to Z Trial - high-dose simvastatin after MI did not improve MACE compared to placebo/low-dose, despite achieving similar LDL targets to PROVE IT and MIRACL
  - Only 16.7% reduction in hsCRP
- Benefit cannot be fully predicted from LDL targets – attributed to different pleiotropic effects

Nissen, JAMA, 2004

Slide from C. Dejong

## Pitavastatin, rosuvastatin, atorvastatin all have potent pleiotropic effects

Cell type	Pleiotropic effect	Atorvastatin	Fluvastatin	Lovastatin	Pitavastatin	Pravastatin	Rosuvastatin	Simvastatin
<b>Platelets</b>	Decreased activation Decreased aggregation	Yes	Yes Yes		Yes [94] Yes [95]		Yes [75]	
<b>Endothelial cells</b>	Increased eNOS expression/activity Decreased ROS Increased endothelial progenitor cell activity/production	Yes	Yes	Yes	Yes [100] Yes [54]		Yes [127]	Yes Yes
<b>Vascular smooth muscle cells</b>	Decreased proliferation Decreased migration Increased apoptosis	Yes	Yes	Yes	Yes [54] Yes [128]		Yes [129] Yes [129]	Yes Yes Yes
<b>Macrophages/ monocytes</b>	Decreased proliferation Decreased MMP expression Decreased oxidized LDL uptake			Yes	Yes [72]	Yes	Yes [130] Yes [131]	Yes
<b>Vascular inflammation</b>	Decreased MHC-II expression Decreased hs-CRP concentrations	Yes [132]		Yes [132] Yes	Yes [58] Yes [61]	Yes [132] Yes	Yes [133]	

eNOS, endothelial nitric oxide synthase; hs-CRP, high sensitivity C-reactive protein; LDL, low density lipoprotein; MHC, major histocompatibility complex; MMP, matrix metallo-proteinase; ROS, reactive oxygen species.

Slide from C. Dejong

Davignon, BJCP, 2011

# Which lowers inflammation more? Rosuvastatin vs. Pitavastatin?

- **Yanagi et al, 2011:** Crossover trial of 90 patients with DM and HLD in Japan
  - 24 weeks: ROS-PIT, PIT-ROS, PIT, or ROS
  - Rosuva 2.5mg led to greater LDL reductions than pitava 2mg (44% vs. 37%)
  - Both lowered inflammatory markers:
    - Rosuva led to greater hsCRP reductions than pitava (20% vs. 12%)
    - Similar reductions in TNF-alpha and plasminogen activator inhibitor-1
- **Take-home:**
  - Variable pleiotropic effects without sufficient head-to-head comparison among PWH
  - Rosuvastatin, pitavastatin, atorvastatin all affect multiple immune/inflammatory pathways

Slide from C. Dejong

# Is pitavastatin cost-effective for primary prevention of ASCVD among PWH?

Boettiger DC et al. *Journal of the International AIDS Society* 2021, **24**:e25690  
<http://onlinelibrary.wiley.com/doi/10.1002/jia2.25690/full> | <https://doi.org/10.1002/jia2.25690>

## RESEARCH ARTICLE

### Cost-effectiveness of statins for primary prevention of atherosclerotic cardiovascular disease among people living with HIV in the United States

David C Boettiger<sup>1,2,§</sup> , Anthony T Newall<sup>3</sup>, Andrew Phillips<sup>4</sup> , Eran Bendavid<sup>5</sup>, Matthew G Law<sup>2</sup>, Lene Ryom<sup>6</sup>, Peter Reiss<sup>7,8</sup>, Amanda Mocroft<sup>4</sup>, Fabrice Bonnet<sup>9</sup>, Rainer Weber<sup>10</sup>, Wafaa El-Sadr<sup>11</sup> , Antonella d'Arminio Monforte<sup>12</sup>, Stephane deWit<sup>13</sup>, Christian Pradier<sup>14</sup>, Camilla I Hatleberg<sup>6</sup> , Jens Lundgren<sup>6</sup>, Caroline Sabin<sup>4</sup>, James G Kahn<sup>1</sup> and Dhruv S Kazi<sup>15,16</sup>

<sup>§</sup>**Corresponding author:** David C Boettiger, Philip R Lee Institute for Health Policy Studies, University of California, San Francisco, 3333 California St, San Francisco, California 94118-1944 USA. Tel: (415) 476 8045. ([dboettiger@kirby.unsw.edu.au](mailto:dboettiger@kirby.unsw.edu.au))

# Methods

- Population: PWH aged 40-75 on ART, not using lipid-lowering therapy
- Data source: Data collection on Adverse Events of Anti-HIV Drugs (D:A:D) study
- Modelled cost effectiveness of no statin, pravastatin 40mg/day (\$236/year), or pitavastatin 4mg (\$2,828/year) for primary prevention of ASCVD over 20 years
- Cost-efficacy threshold set at \$100,000/QALY
- **Assumptions:**
  - 20.5% LDL reduction for pravastatin and 29.7% reduction for pitavastatin (INTREPID trial)
  - In sensitivity analysis, further 10-20% reduction in ASCVD risk due to anti-inflammatory effects
  - 50% reduction in statin adherence (and costs) after year 1

Slide from C. Dejong

# Results

- **Pravastatin compared with no statin:**
  - Pravastatin led to a 9.1%, 8.7% and 5.3% relative reduction in the rate of incident MI, stroke and fatal CVD (less than 1 of each event per 1,000 person years)
  - 0.024 additional QALYs at an incremental cost of \$1,338, resulting in an incremental cost effectiveness ratio (ICER) of \$56,000/QALY gained
- **Pitavastatin compared with pravastatin:**
  - Pitavastatin had a further 5.0%, 4.8% and 5.6% relative reduction in the rate of MI, stroke and fatal CVD
  - 0.013 additional QALYs at an incremental cost of \$18,251, giving an ICER of \$1,444,000/QALY gained
- Pitavastatin outperformed pravastatin if the annual cost was reduced to < **\$350** (12.4% of the base-case price)

Slide from C. Dejong

## Even with 30% additional ASCVD preventative efficacy, the price of pitavastatin needed to drop below 50% of the base-case price to become cost-effective compared with no statin

Boettiger DC et al. *Journal of the International AIDS Society* 2021, **24**:e25690  
<http://onlinelibrary.wiley.com/doi/10.1002/jia2.25690/full> | <https://doi.org/10.1002/jia2.25690>

**FIGURE 2.** ICERs for pravastatin vs. no statin and pitavastatin vs. no statin under various assumptions for statin cost and additional ASCVD prevention efficacy<sup>a</sup>. Horizontal dashed line represents an ICER of \$100,000/QALY gained; <sup>a</sup>The base-case probability of ASCVD while using pravastatin was reduced by various percentages to account for the possibility of preventative efficacy associated with the anti-inflammatory properties of statins in PLHIV; ICER, incremental cost-effectiveness ratio; ASCVD, atherosclerotic cardiovascular disease; QALY, quality-adjusted life-year; PLHIV, people living with HIV.

# Pitavastatin: what do we know?

- T/F questions:

1. T/F: For individuals with ASCVD, Pitavastatin is clinically indicated

**False-it is a moderate intensity statin and for high risk individuals high intensity statins (atorvastatin/rosuvastatin) are indicated**

2. T/F: Pitavastatin is cost effective for use in PWH

**False – Cost of \$10 per pill, only cost effective if price reduced to \$350 per year; atorvastatin/rosuvastatin, generic which may be alternatives**

3. Fill in the blank: In the past 20 years, Dr. Hsue has prescribed pitavastatin \_\_\_ times

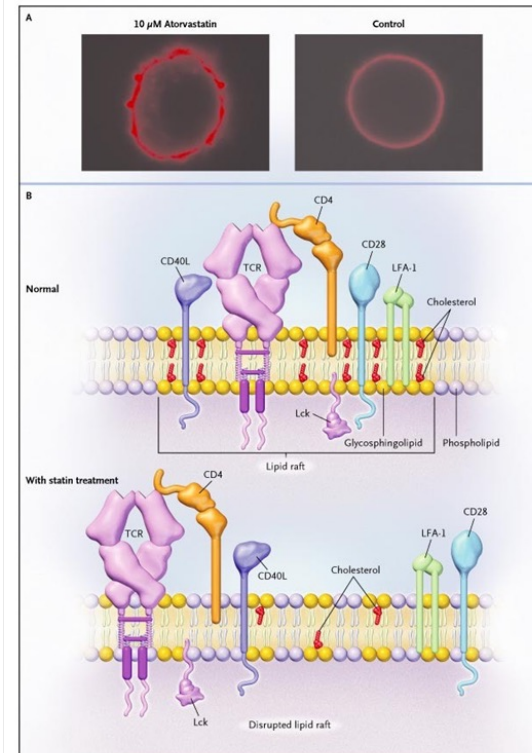

**Answer: 0!**

*Where do we go from here? Other than statins how are we going to reduce ASCVD risk among PWH?*

- Will a **lower** LDL goal in PWH be beneficial for primary prevention?
- Will lowering LDL **earlier** in PWH be beneficial?

## Question:

- What LDL-C goal should we target for PWH?
  - <100mg/dL
  - <70mg/dL
  - <50mg/dL
  - <25mg/dL

***Answer is unknown but growing body of evidence suggests that **lower** is better for LDL-C, and furthermore lowering LDL-C **earlier** may be beneficial***

Verve trial of gene editing for PCSK9 in humans

- Was benefit of statin tx in REPRIEVE independent of lipid lowering?
  - Yes
  - No
  - I don't know... 

**Statins lower both LDL-C and inflammation so challenging to say if the benefit was independent**

# Residual inflammatory risk: what are options after statin treatment?

*Ridker PM European Heart Journal 2016*

# Role of Inflammation/Immune Activation and CVD in PWH:

- Our group and others defined the key link between immunodeficiency and CVD
- CV risk persists in the setting of treated and suppressed HIV
- Chronic inflammation/immune activation remains elevated in the setting of effectively treated HIV
- In turn, inflammation is independently predictive of CVD
- Focus on inflammation/immune activation as underlying mechanism of HIV-associated CVD and other comorbidities

## Role of T-Cell Dysfunction, Inflammation, and Coagulation in Microvascular Disease in HIV

Arjun Shih, MD, MS; Yifei Ma, MS; Rebecca Scherzer, PhD; Sophia Har, MPH; Danny Li, BS; Peter Ganz, MD; Steven G. Deeks, MD; Priscilla Y. Hsue, MD

**Background**—Compared to uninfected adults, HIV-infected adults on antiretroviral therapy are at increased risk of cardiovascular disease. Given the increase in T-cell dysfunction, inflammation, and coagulation in HIV infection, microvascular dysfunction is thought to contribute to this excess cardiovascular risk. However, the relationships between these variables remain undefined.

**Methods and Results**—This was a cross-sectional study of 358 HIV-infected adults from the SCOPE cohort. Microvascular endothelial function was assessed using flow-mediated dilation of the brachial artery and microvascular function by reactive hyperemia. T-cell phenotype was determined by flow cytometry. Plasma markers of inflammation (tumor necrosis factor- $\alpha$ , interleukin-6, high-sensitivity C-reactive protein, sCD14) and coagulation (fibrinogen, D-dimer) were also measured. In all HIV+ subjects, markers of inflammation (tumor necrosis factor- $\alpha$ , high-sensitivity C-reactive protein), coagulation (D-dimer) and T-cell activation (CD8+PD1+, CD4+interferon- $\gamma$ /cytomegalovirus-specific) were associated with worse reactive hyperemia after adjusting for traditional cardiovascular risk factors and confounders. In treated and suppressed subjects, tumor necrosis factor- $\alpha$  and CD8+PD1+ cells remained associated with worse reactive hyperemia after adjustment. Compared to the untreated subjects, CD8+PD1+ cells were increased in the virally suppressed group. Reactive hyperemia was predictive of flow-mediated dilation.

**Conclusions**—CD8+PD1+ cells and tumor necrosis factor- $\alpha$  were associated with microvascular dysfunction in all HIV+ subjects and the treated and suppressed group. Additionally, D-dimer, high-sensitivity C-reactive protein, sCD14, and interleukin-6 were associated with microvascular dysfunction in all HIV+ subjects. Although T-cell dysfunction, inflammation, and microvascular dysfunction are thought to play a role in cardiovascular disease in HIV, this study is the first to look at which T-cell and inflammatory markers are associated with microvascular dysfunction in HIV-infected individuals. (*J Am Heart Assoc*. 2016;5:e004243 doi:10.1161/JAHA.116.004243)

**Key Words:** coagulation • HIV • immune system • inflammation • microcirculation

**Lancet May 2021**

77-92% reduction in hsCRP among individuals with CKD and >2mg/L hsCRP

Ridker PM Circulation 2020

## Summary:

- Statins have been shown to be beneficial in virtually all populations, including PWH
- Regardless of HIV status, all persons with DM or with calculated ascvd risk of 7.5% or higher should be on moderate intensity statin
- For PWH: Reprieve suggests benefit for statins
  - Likely with ASCVD risk of 5% and above
  - However, some PWH with low calculated ASCVD risk may benefit from statin, role of imaging?
- Pitavastatin is a moderate intensity statin; other statins such as atorvastatin/rosuvastatin could be considered, particularly given cost differential

# Looking forward, how do we reduce ascvd risk among PWH?

- Should statin be started earlier instead of later?
- Will there be a benefit of achieving a lower LDL-C in PWH using different lipid lowering agents?
- What anti-inflammatory therapies could be used on top of statin to reduce risk?
- Can we use imaging to ascertain statin decision in PWH at low calculated ASCVD risk?
