Background

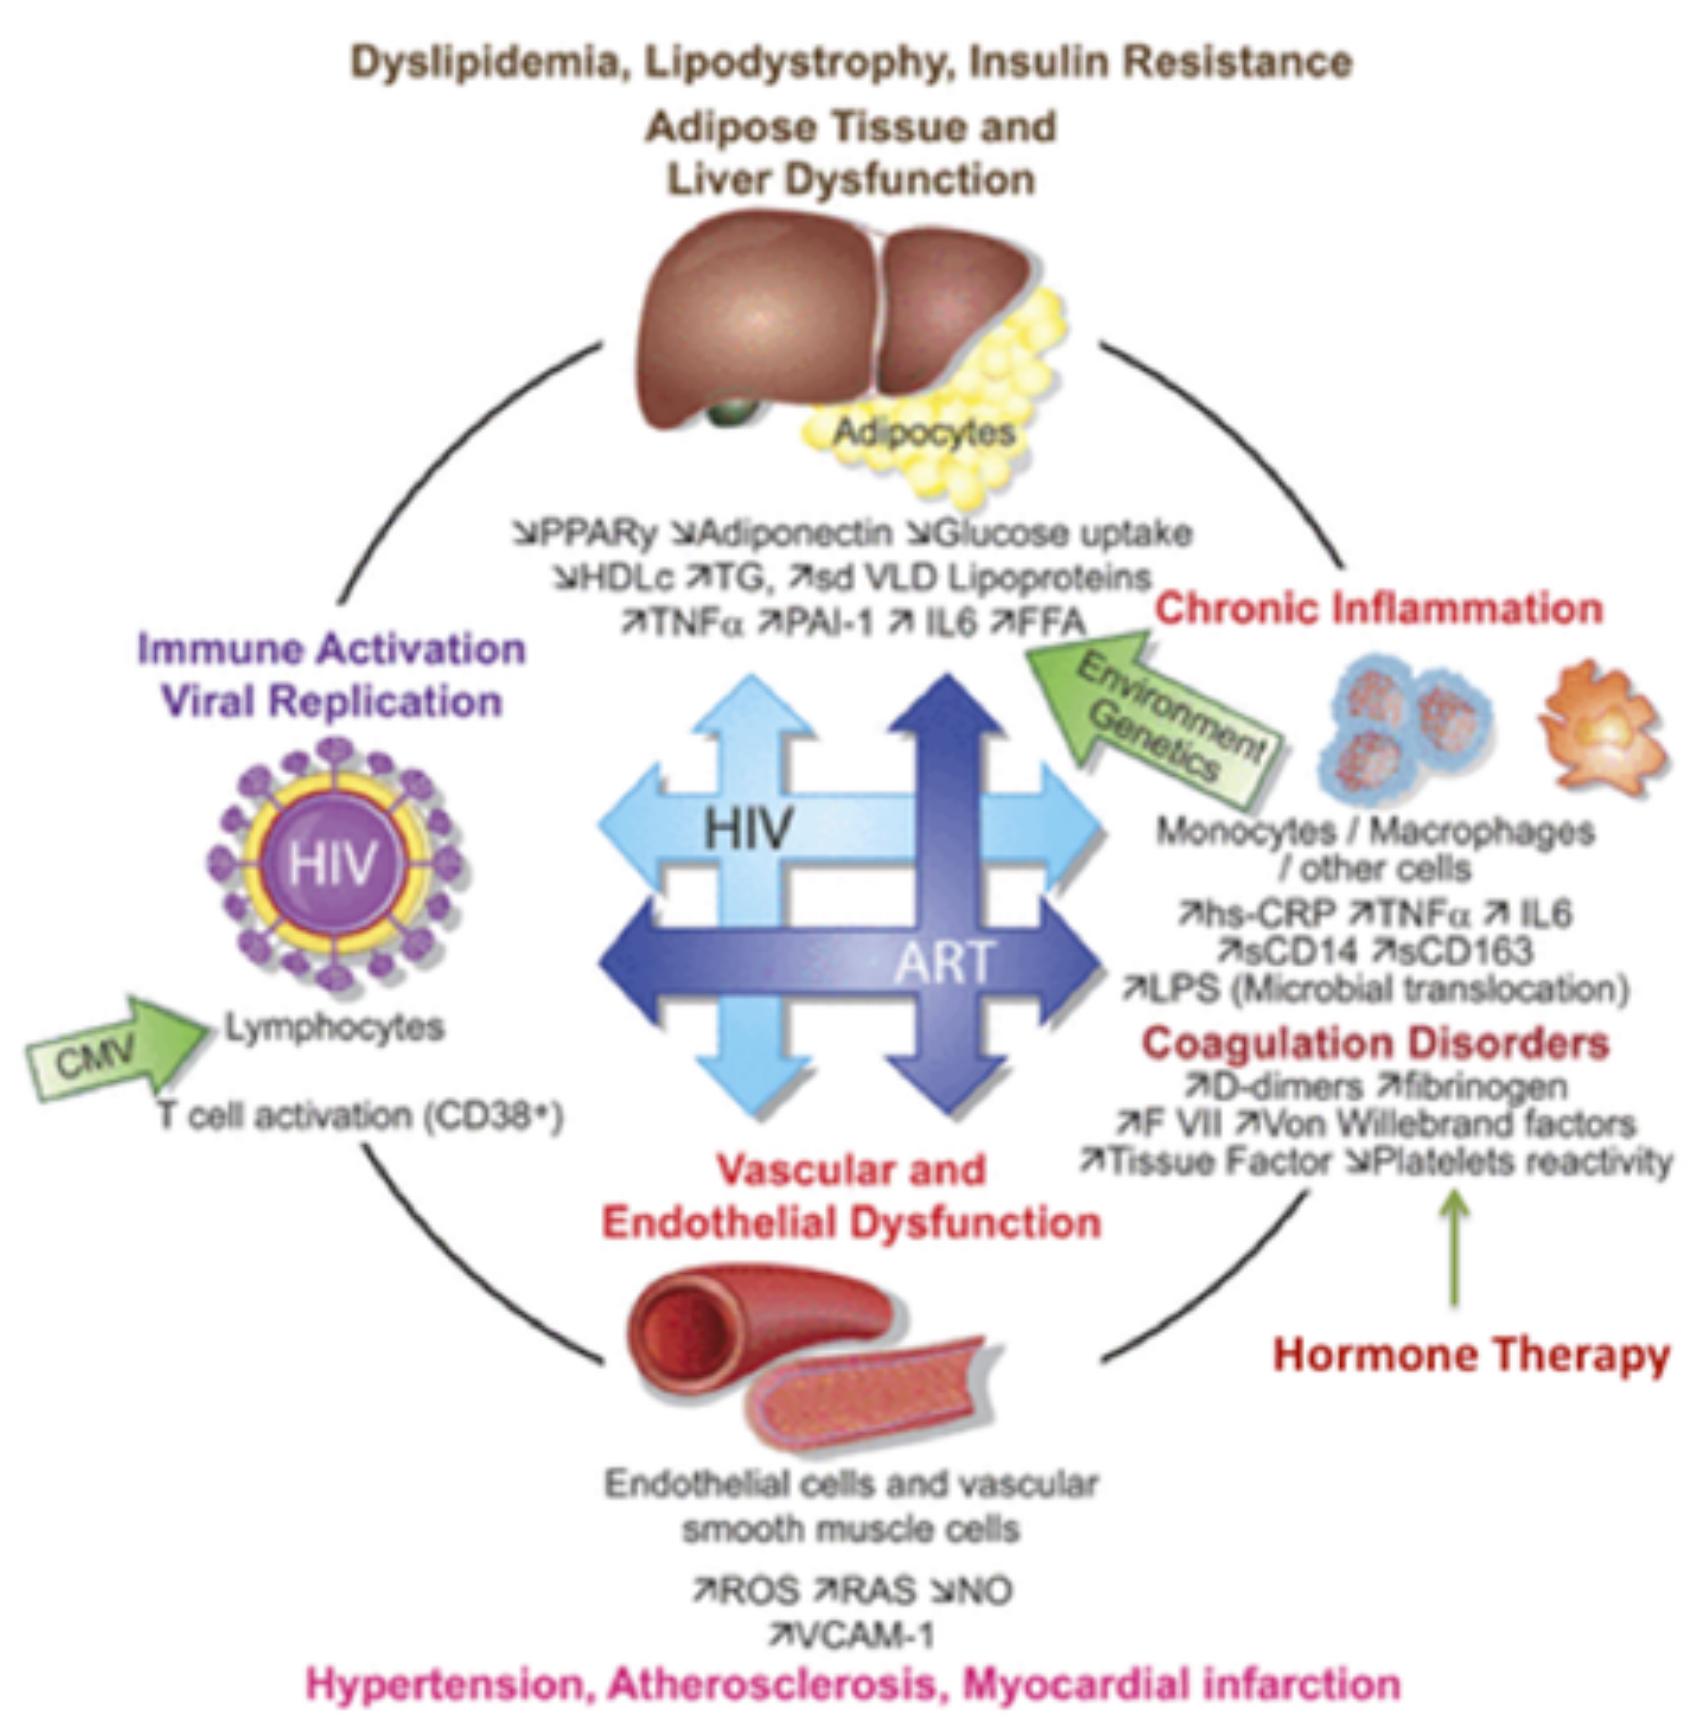

Figure 1. Contributions of HIV and FHT to metabolic and inflammatory disease. Adapted from Hemkens and Bucher. Eur Heart J. 2014.

- Transgender women (TW) are disproportionately affected by HIV and have a high prevalence of modifiable cardiovascular disease (CVD) risk factors.^{1,2}
- Feminizing hormonal therapy (FHT) and HIV potentially alter CVD risk in TW.³
- We assessed serum biomarkers of CVD risk and inflammation among TW by HIV serostatus and FHT use, compared to cis-gender male (CM) controls.

Methods

Population:

- TW from community-based organizations and clinics in Los Angeles, California and Houston, Texas
- TW were frequency-matched to Multicenter AIDS Cohort Study CM on age, race, substance use and antiretroviral therapy (ART) type.
- All participants with HIV were on ART.
- For regression analyses, TW with HIV (n=51) had HIV-1 RNA<50 copies/mL.

Analysis:

- Serum biomarker profiles were assessed via ELISA.
- Wilcoxon rank sum and Fisher's exact tests compared group differences.
- Multivariable linear regression analyses assessed factors associated with natural log-transformed biomarker concentrations after adjusting for HIV serostatus, gender, age, race/ethnicity, body mass index (BMI), and smoking.

Results

Table 1: Baseline Characteristics

	CM, HIV- (N=40)	CM, HIV+ (N=40)	TW, HIV- (N=47)	TW, HIV+* (N=75)
Age	43 (35, 52)	48 (43, 54)	40 (32, 48)	43 (37, 52)
Black race	13%	23%	13%	27%
Hispanic ethnicity	65%	60%	64%	57%
Overweight/obese	58%	67%	30%	24%
Smoking history (former or current)	80%	86%	50%	48%
Recreational drug use	28%	48%	23%	41%
Alcohol use				
<14 drinks/week	73%	78%	37%	45%
≥14 drinks/week	5%	3%	11%	8%
Hypertension	40%	39%	17%	33%
Diabetes mellitus	13%	19%	15%	13%
ART regimen				
NNRTI-based	43%		24%	
PI-based	45%		20%	
INSTI-based	13%		49%	
CD4+ T lymphocyte count (cells/µL)	650 (466,846)		580 (391,841)	
CD4+ T lymphocyte nadir <200 (cells/µL)	48%		54%	
Detectable HIV-1 RNA	0%		32%	
Any AIDS diagnosis	8%		36%	
Feminizing Hormonal Therapy		66%	68%	

Frequency or median (interquartile range) presented. *When restricting to TW with suppressed HIV-1 RNA, age and smoking and alcohol use frequency more closely resembled CM. TW=transgender women, CM=cis-gender men, NNRTI= non-nucleoside reverse transcriptase inhibitors, PI=protease inhibitors, INSTI=integrase strand transfer inhibitors

Results

Table 2a: Biomarker Concentrations by Gender in Participants Without HIV

	TW (N=47)	CM (N=40)	P-value
Adiponectin (ng/mL)	3034.7 (1696.8-5015.4)	2723.0 (1307.0-3678.9)	0.344

PAI-1 (ng/mL)	0.67 (0.50, 0.83)	<0.001
Insulin (mU/mL)	-0.01 (-0.41, 0.38)	0.942

Adjusted for HIV status, age, race/ethnicity, BMI, and smoking status.

Summary & Conclusions

- Compared to matched cis-gender males, transgender women have altered profiles of biomarkers associated with systemic inflammation and CVD that seem to be influenced by both FHT and HIV.
- TW had significantly higher ENRAGE, oxidized LDL, sTNFRI, sTNFRII, IL-8 and PAI-1 concentrations, regardless of HIV serostatus.
- Stepwise increase of oxidized LDL, ENRAGE, PAI-1, and sTNFRI were seen, with CM < TW not on FHT < TW on FHT.
- Clinical outcomes data and mechanistic studies are needed to understand the contributions of FHT and HIV to CVD risk among TW.
